# Scripts

- 1 Scripts
- 2 Build Tools
- 3 Development Tools
- 4 Meeting
  - Recapitulation

# Learning Outcomes

After successful completion of L03  
students will be able to

- remember how development tools help
- make modifications in scripts

# Scripts

FLOSS encourages to:

- combine
- modify
- share

## Finding

Can be easily done using scripts.

# Portable Shell Scripts

- defined by POSIX
- supported by most shells like bash, zsh, ...
- use `#!/bin/sh` as shebang

development tools:

- checkbashisms (in devscripts, `check_bashisms`)
- shfmt (`check_posix`)
- shellcheck

# Reformatting (1)

Serial variant of scripts/dev/reformat-all

```
1 #!/bin/sh
2 #
3 #_@author_Klemens
4 #_@brief_Calls_all_other_reformat_scripts
5 #_@date_29.03.2019
6 #_@tags_reformat
7
8 DEV_SCRIPTS_DIR=$(dirname "$0")
9 ._ "${DEV_SCRIPTS_DIR}/include-common"
10
11 cd "$SOURCE" || _exit
12
```

## Reformatting (2)

```
13 reformat() {
14 ____reformat=$1
15 ____shift
16 ____echo "starting $reformat ..."
17 ____"$reformat" "$@"
18 ____echo "finished $reformat"
19 }
20
21 IFS= '
22 '
23 for reformat in "$DEV_SCRIPTS_DIR"/reformat-*; do
24 ____["$(basename "$reformat")" = "reformat-all"] && continue
25 ____reformat "$reformat" "$@"
26 done
```

## Build Tools

- 1 Scripts
- 2 Build Tools
- 3 Development Tools
- 4 Meeting
  - Recapitulation

# Goals

Build tools:

- (cross-)compile the software
- generate documentation and other files
- run scripts, shared with build server
- run tests (e.g., ctest)
- create packages (e.g., cpack)

# Generation

How build tools typically:

- e.g. automake generates `./configure` shell scripts, which generates Makefiles
- e.g. CMake generates Makefiles, Ninja or project files of various IDEs
- other build tools directly invoke the compiler

## Task

Which build tool do you know? How does it work?

## Example: Elektra Plugins

README.md of plugins is used:

during configure time: include/exclude plugins based on infos/status

during build time: README.md gets included in the plugin's code

at run time: mounting plugins using infos/provides

Implementation see `scripts/cmake/Modules/LibAddPlugin.cmake`

# CMake: Different Configurations

Common variants of how to run cmake are in scripts/dev/configure-\*

```
1 cmake _\
2 -DPLUGINS="ALL;-EXPERIMENTAL" _\
3 -DTOOLS="ALL" _\
4 -DENABLE_DEBUG="ON" _\
5 -DENABLE_LOGGER="ON" _\
6 .
```

# Environment

- 1 use Docker
- 2 `./scripts/dev/run_env` which basically does:

```
1 #_common_configure_script
2 export _SCRIPTS_DIR="${ELEKTRA_DIR}/scripts/dev"
3 ._ "${SCRIPTS_DIR}/include-common"
4
5 export _PATH="$BUILD/bin:$SCRIPTS_DIR:$PATH"
6 export _KDB_EXEC_PATH="$COMMON_PATH:$KDB_EXEC_PATH"
7 export _LD_LIBRARY_PATH="$BUILD/lib:$LD_LIBRARY_PATH"
8 export _MANPATH="$SOURCE/doc/man:$MANPATH"
9 export _CLASSPATH="$CLASSPATH:$BUILD/lib/libelektra.jar"
10
11 export _PS1="[DEV]_ $PS1"
```

## Development Tools

- 1 Scripts
- 2 Build Tools
- 3 Development Tools**
- 4 Meeting
  - Recapitulation

# Use Tools or Libraries?

Example: Internationalization (i18n) and Localization (L10n)

- self-made key/value lookup
- GNU gettext model, plural, context

## Finding

Quickly pays off to learn FLOSS tools.

# Licensing Check Tools

If you copy FLOSS to Elektra's source, make sure:

- it is BSD-licensed (or less restricted)
- license information is added in `.reuse/dep5`

<https://reuse.software/>

# Elektra's Test Tools

See `doc/TESTING.md`:

- valgrind
- ASAN
- AFL++
- Shell Recorder
